The Midnight Ledger · Camera

Try one piece of the museum evidence case. A camera clock and a known test pulse give enough information to correct a sighting.

The next page is the puzzle; page3 contains hints and its answer. This fragment does not include the complete case or its conclusions.

Correct the lobby camera

A technician triggered a test pulse at a known real time. The camera ran at normal speed, and its clock offset stayed constant throughout the interval.

Event	Real time	Camera display
Test pulse	21:10	21:06
Trolley at JUNCTION	unknown	21:18

How many minutes fast or slow is the camera? _____

What real time corresponds to the trolley image? _____

The image shows a trolley and packet; it does not identify a face or contents.

Camera · solution

First hint: compare the real and displayed time of the same pulse. Second: the display is four minutes behind.

Answer: camera offset4 minutes slow; display21:18 means real21:22.

Full kit adds the badge timeline, floor route, packet count, transfer records, locker evidence and donation audit.
